Radiology AI | Codex master prompt and repo alignment

Frontend specification package - October 2026 | Planning baseline, not a repository audit

Instructions to paste into Codex

MASTER PROMPT - You are a senior frontend architect implementing the Radiology AI frontend. FIRST inspect the frontend repository and relevant ASP.NET Core backend repository; read AGENTS.md and project documentation. Identify implemented endpoints, authentication, DTOs, workflows, existing tests and gaps. Do not assume the backend supports any proposed endpoint. Present a concise gap analysis and phased plan BEFORE editing. Use React, TypeScript strict, Vite, React Router, TanStack Query, React Hook Form, Zod, accessible components, i18n (Albanian/English), Vitest, React Testing Library and Playwright unless existing architecture warrants a justified alternative. Build a feature-first app with typed API adapters and synthetic MSW fixtures. Backend is the source of truth for role/tenant authorization, report signing, audit and AI inference. Framework and AI-Framework are .NET libraries consumed through backend APIs, never imported directly into React. Build responsive worklists, patient/study detail, clinician-reviewed reporting and transparent AI suggestion states. Evaluate OHIF/DICOMweb integration instead of building a viewer from scratch. No real patient data, no PHI in client logs/storage, no autonomous diagnosis or AI auto-sign. Add loading/empty/error states, permission tests, accessibility tests, CI and clear README. For each phase: list files changed, decisions, API dependencies, tests run, unresolved blockers and next steps. Start with repository audit and propose Phase 1; implement only after requirements and existing contracts are confirmed.

Initial tasks

Task 1 - Inspect existing repos and report gaps against the six frontend specifications.

Task 2 - Define OpenAPI-backed DTOs, mocks and UI screen map.

Task 3 - Scaffold frontend architecture and create initial worklist/patient detail with synthetic fixtures.

Task 4 - Add clinical visualization adapter, report workflow and AI review only when contracts exist.

Non-negotiable constraints

Safety - Clinician remains accountable for diagnosis and final signed report; validate clinical AI separately before deployment.

Compliance - Assess Kosovo data protection obligations, hosting/transfer restrictions, medical-device classification and clinical governance with qualified counsel and clinicians before real patient use.
